

Anoka-Hennepin Secondary Curriculum Unit Plan

Department:	Mathematics	Course:	Intermediate PreAlgebra	Unit 9 Title:	Data and Probability (Experimental, Theoretical and Geometric)	Grade Level(s):	7
Assessed Trimester:	Trimester 3	Pacing:	8-13 Days	Date Created:	5/31/2014	Last Revision Date:	6/18/2014

<b>Course Understandings:</b> <i>Students will understand that:</i> <ul style="list-style-type: none"><li>A. There are multiple strategies and representations that can be used to solve real world problems involving rational numbers.</li><li>C. Proportional reasoning and percents can be used to solve real world problems.</li><li>E. Probabilities can be used to predict situational outcomes.</li><li>F. There are multiple ways to represent data and interpret the results.</li><li>G. There are appropriate uses for various technologies and that limitations may exist with them.</li></ul>
--

DESIRED RESULTS (Stage 1) - WHAT WE WANT STUDENT TO KNOW AND BE ABLE TO DO?

Established Goals
<b>Minnesota State/Local/Technology Standard(s) addressed (2007):</b> <ul style="list-style-type: none"><li><b>Standard (7.4.1.#):</b> Use mean, median, and range to draw conclusions about data and make predictions. <b>Benchmark:</b><ul style="list-style-type: none"><li><b>7.4.1.1</b> Design simple experiments and collect data. Determine mean, median, and range for quantitative data and from data represented in a display. Use these quantities to draw conclusions about the data, compare different data sets, and make predictions.</li><li><b>7.4.1.2</b> Describe the impact that inserting or deleting a data point has on the mean and median on a data set. Know how to create data displays using a spreadsheet to examine the impact.</li></ul></li><li><b>Standard (7.4.2.#):</b> Display and interpret data in a variety of ways, including circle graphs and histograms. <b>Benchmark:</b><ul style="list-style-type: none"><li><b>7.4.2.1</b> Use reasoning with proportions to display and interpret data in circle graphs (pie charts) and histograms. Choose the appropriate data display and know how to create the display using a spreadsheet or other graphing technology.</li></ul></li><li><b>Standard (7.4.3.#):</b> Calculate probabilities and reason about probabilities using proportions to solve real-world and mathematical problems. <b>Benchmark:</b><ul style="list-style-type: none"><li><b>7.4.3.1</b> Use random numbers generated by a calculator or a spreadsheet or taken from a table to simulate situations involving randomness, make a histogram to display the results, and compare the results to known probabilities.</li><li><b>7.4.3.2</b> Calculate probability as a fraction of sample space or as a fraction of area. Express probabilities as percents, decimals and fractions.</li><li><b>7.4.3.3</b> Use proportional reasoning to draw conclusions about and predict relative frequencies of outcomes based on probabilities.</li></ul></li></ul>
Transfer
<b>Students will be able to independently use their learning to: (product, high order reasoning)</b> <ul style="list-style-type: none"><li>Solve real-world and mathematical problems involving probabilities and measures of central tendency.</li></ul>

Meaning	
<div>Unit Understanding(s):</div> <div>Students will understand that:</div> <ul style="list-style-type: none"><li>• Predictions can be made using numerical and geometric probabilities.</li><li>• Adding or removing a data point affects the measures of central tendency.</li><li>• There are multiple representations of data and know how to determine the most appropriate representation.</li><li>• Various data displays can be used to determine measures of central tendencies and make predictions.</li></ul>	<div>Essential Question(s):</div> <div>Students will keep considering:</div> <ul style="list-style-type: none"><li>• How is the probability of an event determined and described?</li><li>• How does the type of data influence the choice of display?</li><li>• How can information be gathered, recorded, and organized?</li><li>• Why is data collected and analyzed?</li><li>• How do people use data to influence others?</li><li>• How can predictions be made based on data?</li><li>• How is probability used in everyday life?</li></ul>
Acquisition	
<div>Knowledge - Students will:</div> <ul style="list-style-type: none"><li>• Understand mean, median, range, and outliers.</li><li>• Understand how to write probability as a fraction, decimal, and percent.</li><li>• Identify sample space</li><li>• Understand and define probability.</li><li>• Understand the meaning of probability as part/whole.</li><li>• Understand data displays such as circle graphs, histograms, frequency tables, and stem-and-leaf plots.</li></ul> <div>Reasoning - Students will:</div> <ul style="list-style-type: none"><li>• Choose appropriate measure of central tendency.</li><li>• Draw conclusions resulting from data.</li><li>• Predict the impact of inserting or deleting a data point and how it affects the mean and median of a data set.</li><li>• Predict and justify frequencies of probability outcomes.</li><li>• Develop a plan for organizing data.</li><li>• Choose the appropriate data display given the data.</li><li>• Predict and justify frequencies of probability outcomes.</li></ul>	<div>Skills - Students will:</div> <ul style="list-style-type: none"><li>• Determine mean, median, and range.</li><li>• Create a circle graph or histogram.</li><li>• Carry out the appropriate computation to find the geometric probability.</li><li>• Use an experiment to find the experimental probability.</li><li>• Use multiple technologies to display data.</li></ul>

<div>Common Misunderstandings</div> <ul style="list-style-type: none"><li>• Students forget to find the average when finding the median of an even set of numbers.</li><li>• When students are asked to find the mean of a data set and have access to their calculator, they may forget to enter the calculations using the correct order of operations.</li><li>• When finding the median students may forget to put the data in order from least to greatest.</li><li>• As students make histograms, sometimes they do not use equal intervals on the horizontal axis.</li><li>• Students may assume the percent shown on a circle graph is the equal to the number of responses in that category. (24% means 24 people)</li><li>• Students may confuse experimental probability and theoretical probability.</li><li>• Students often draw incorrect conclusions about how probability works in real life situations. For example, a student may claim that since the probability of getting tails is 0.5, tails will come up twice after 4 coins flips. Explain that if an event has a 50% probability, this does not mean it happens 50% of the time in application.</li></ul>	<div>Essential new vocabulary</div> <ul style="list-style-type: none"><li>• Circle Graph</li><li>• Frequency Table</li><li>• Histogram</li><li>• Outlier</li><li>• Stem-and-Leaf Plot</li></ul>
