

Anoka-Hennepin Secondary Curriculum Unit Plan

Department:	Mathematics	Course:	Geometry (Honors)	Unit 4 Title:	Quadrilaterals	Grade Level(s):	8, 9, 10
Assessed Trimester:	Trimester A	Pacing:	High School: 8 - 10 Middle School: 11 - 13	Date Created:	05/22/2014	Last Revision Date:	08/20/2014

<b>Course Understandings:</b> <i>Students will understand that:</i> <ul style="list-style-type: none"><li>B. Coordinate geometry can be used in order to demonstrate spatial relationships.</li><li>C. Reasoning skills are required to construct a logical argument.</li><li>E. Known geometric measurements are used to derive formulas of two- and three-dimensional figures in order to be used in real world situations.</li><li>F. Properties of two- and three-dimensional figures can be used in classification and problem solving.</li><li>G. Visualization models can be used to solve geometric problems</li></ul>
--

DESIRED RESULTS (Stage 1) - WHAT WE WANT STUDENT TO KNOW AND BE ABLE TO DO?

Established Goals	
<b>Minnesota State/Local/Technology Standard(s) addressed (2007):</b> <ul style="list-style-type: none"><li><b>Standard (9.3.3.#):</b> Know and apply properties of geometric figures to solve real-world and mathematical problems and to logically justify results in geometry. <b>Benchmark:</b> <b>9.3.3.7</b> Use properties of polygons—including quadrilaterals and regular polygons—to define them, classify them, solve problems and logically justify results.</li><li><b>Standard (9.3.4.#):</b> Solve mathematical geometric problems using algebraic methods. <b>Benchmark:</b> <b>9.3.4.4</b> Use coordinate geometry to represent and analyze line segments and polygons, including lengths, midpoints and slopes of line segments.</li></ul>	
Transfer	
<b>Students will be able to independently use their learning to: (product, high order reasoning)</b> <ul style="list-style-type: none"><li></li></ul>	
Meaning	
<b>Unit Understanding(s):</b> <b>Students will understand that:</b> <ul style="list-style-type: none"><li>quadrilaterals can be classified into a "hierarchy."</li><li>not all quadrilaterals fit into one of the categories of "special" quadrilaterals.</li><li>the slope of a line or segment can be determined using various strategies.</li><li>the distance between two points on a coordinate plane can be determined using various strategies.</li><li>the midpoint of a segment, given the coordinates of the endpoints can be determined using various strategies.</li><li>given the equation of a circle, the center and radius of the circle can be determined.</li><li>given the center and radius (or diameter) of a circle, the equation of the circle can be determined.</li></ul>	<b>Essential Question(s):</b> <b>Students will keep considering:</b> <ul style="list-style-type: none"><li></li></ul>

Acquisition	
<b>Knowledge - Students will:</b> <ul style="list-style-type: none"><li>Recognize interior and exterior angles</li><li>Know the following formulas and how they relate to quadrilaterals:<ul style="list-style-type: none"><li>Slope</li><li>Midpoint Formula</li><li>Distance Formula</li></ul></li></ul>	<b>Reasoning - Students will:</b> <ul style="list-style-type: none"><li>Distinguish between different quadrilaterals based upon given characteristics</li><li>Distinguish the difference between the slopes of parallel and perpendicular line segments</li><li>Classify a quadrilateral given slopes and/or side lengths and justify reasoning</li></ul> <b>Skills - Students will:</b> <ul style="list-style-type: none"><li>Use characteristics of the polygon to find missing measurements, angles and values</li><li>Use slope, midpoint and distance formula to classify a quadrilateral</li><li>Use the distance formula to find lengths of segments</li></ul>

<b>Common Misunderstandings</b> <ul style="list-style-type: none"><li>Students sometimes have a hard time with the "nesting" feature of quadrilaterals, i.e., a square is nested inside parallelograms, which is nested inside quadrilaterals, which is nested inside polygons, etc.</li><li>Students sometimes interchange properties where they shouldn't. <i>For example</i>, a parallelogram has diagonals that bisect each other, and some students will extend that to other types of quadrilaterals.</li><li>Students sometimes confuse clockwise rotations with counterclockwise rotations.</li><li>Students sometimes confuse a rotation of positive degree measure, which rotates a figure counterclockwise, with a rotation of negative degree measure, which rotates a figure clockwise.</li><li>Students often mistake the formula for slope with the formula for midpoint and/or the Distance Formula.</li></ul>	<b>Essential new vocabulary</b> <ul style="list-style-type: none"><li>isosceles trapezoid</li><li>kite</li><li>midpoint</li><li>rhombus</li><li>trapezoid</li></ul>
