1. Phillip, Peter and Pablo each throw a ball over a fence. The height of Phillip’s ball with respect to time can be modeled by the equation \( y = -16t^2 + 60t \). The height of Peter’s ball with respect to time can be modeled by the equation \( y = -16t^2 + 50t \). The height of Pablo’s ball with respect to time can be modeled by the equation \( y = -16t^2 + 40t \), where \( y \) is the height in feet and \( t \) is the time in seconds for each of the three models.

   b) Whose ball hit the ground first? How long did it take?

   \[ \text{Pablo: } 2.5 \text{ sec} \]

   c) Whose ball hit the ground second? How long did it take?

   \[ \text{Peter: } 3.125 \text{ sec} \]

2. A quarterback throws a football at an initial height of 5.5 feet with an initial upward velocity of 35 feet per second. The height of a tossed ball with respect to time can be modeled by the quadratic function \( h(t) = -16t^2 + v_0 \cdot t + h_0 \) where \( v_0 \) is the initial upward velocity, \( h_0 \) is the initial height and \( h(t) \) is the height of the ball after \( t \) seconds.

   a) Write the function that models the height of the ball with respect to time.

   \[ h(t) = -16t^2 + 35t + 5.5 \]

   b) How high will the football be after 1 second? (Consider what the 1 second represents.)

   \[ 24.5 \text{ ft} \] (the 1 sec represents the x-value)

   c) When will the football be 10 feet high? (Consider what the 10 feet represents.)

   After 0.49 secs and again after 2.05 secs (the 10 is the y-value)

   d) When will the football reach its maximum height? (When graphing the function, consider what significant feature of the graph represents this concept.)

The amount of algae in the pool \( t \) days after the treatment begins can be approximated by the function \( A(t) = 4t^2 - 88t + 500 \).       \[ t = 1.5 \text{ secs} \]

   b) What was the maximum speed reached?
      \[ 89 \text{ km/h} \]

      \[ 6.22 \text{ seconds} \]
6. Andrew has 100 feet of fence to enclose a rectangular tomato patch. He wants to find the dimensions of the rectangle that encloses the most area. The width of the rectangle can be found by the expression $50 - L$ where $L$ is the length of the rectangle.

   a) In the expression representing the width of the rectangle ($50 - L$), what does the 50 represent? Explain your thinking clearly.

   $50$ is half the perimeter, so one length + one width = $50$.

   b) Write a function rule to model the area of the rectangle. $A(L)$ represents the Area of the rectangular tomato patch base on the length ($L$) of one side.

   $$A(L) = L \left(50 - L\right)$$

   So $A(L) = -L^2 + 50L$

   c) Find the coordinate representing the maximum of the graph. Explain its meaning in the context of the situation.

   $\left(25, 625\right)$ when the length is 25, width is $50 - 25 = 25$

   $A = 25 \times 25$

   $A(L) = 625$

   d) What size should Andrew make the tomato patch in order to enclose the most area within the fencing?

   A Square shape, 25 ft x 25 ft

7. Sharon needs to create a fence for her new puppy. She purchased 40 feet of fencing to enclose the four sides of a rectangular play area.

   a) Determine the dimensions the enclosure play area should be to produce the greatest area for her puppy to play.

   According to $A = L \left(40 - L\right)$

   $S = 40 \div 4 = 10$ ft on each side.

   b) Write a function rule to model the area of the play area.

   $A(L) = L \left(40 - L\right)$

   So $A(L) = -L^2 + 40L$

   Calc max shows vertex at $(10, 200)$

   c) What are the dimensions of the enclosure that will create the greatest area for her puppy to play?

   Length $L = 10$ ft

   Width $40 - L = 30$ ft

   Area $= 100$ ft$^2$

If Jim's outstretched arms are 16 feet above the ground, will the orange ever be high enough so that he can catch it? Explain your answer.

   Yes! The max height of the orange is 19 ft, or the $y$ coordinate of the vertex. Jim can grab it either on the way up or the way down.

9. On wet concrete, the stopping distance, $s$ (in feet), of a car traveling $v$ miles per hour is given by $s(v) = 0.055v^2 + 1.1v$. At what speed could a car be traveling and still stop at a stop sign 30 feet away?

   $(v, 5(v))$

   $(v, 30)$

   $141.56$ ft

   b) How long does it take for the water to hit the ground?

   $5.79$ secs

a) Other than simplifying to the different numeric values, identify 2 or more differences in the process shown used in methods 1 and 2.

1) In method 1, Kasem never used the definition of \( i = \sqrt{-1} \) to rewrite either radical incorrectly.

2) Method 1 used the product property of radicals incorrectly, only if \( a \) and \( b \) are both nonnegative with an even index, is \( \sqrt{a} \cdot \sqrt{b} = \sqrt{ab} \) method 2 used the product property of radicals correctly.

b) Although the methods have created different numeric values when simplifying, identify 2 or more similarities in the process shown in methods 1 and 2.

1) Both methods combined \( \sqrt{4} \cdot \sqrt{9} = \sqrt{36} \) instead of simplifying each separately.

2) Both methods used that \( \sqrt{36} = 6 \)

c) Although the methods have created the same numeric value, identify 2 or more differences in the process shown through methods 2 and 3.

1) From line 3 to line 4, multiplication was done in a different order by commutative property for multiplication.

2) Method 3 simplified the radicals \( \sqrt{47} \) and \( \sqrt{9} \); method 2 multiplied them together.

d) Other than simplifying to the same numeric values, identify 2 or more similarities in the process shown in methods 2 and 3.

10. Emma hits a golf ball off the tee. The height of the ball is given by \( h(x) = -16x^2 + 4000x + 3248 \) where \( h \) is the height in yards above the ground and \( x \) is the horizontal distance from the tee in yards. How far does Emma hit the ball? (Solve by Completing the Square and round your solution to the nearest hundredth.)

\[
\begin{align*}
-16x^2 + 4000x & = -3248 \\
\frac{x^2 - 250x + 15625}{(x-125)^2} & = \frac{203 + 15625}{15625} \\
\sqrt{(x-125)^2} & = \sqrt{15820} \\
|x-125| & = 125.81 \\
x-125 & = \pm 125.81 \\
x & = 250.81, -0.81 \text{ (not reasonable)}
\end{align*}
\]

11. Gail and Veronica are fixing a leak in a roof. Gail is working on the roof and Veronica is tossing up supplies to Gail. When Gail tosses up a tape measure, the height \( h \), in feet, of the object above the ground \( t \) seconds after Veronica tosses it is \( h(t) = -16t^2 + 32t + 5 \). Gail can catch the object any time it is above 17 feet.

How much time does Gail have to try to catch the tape measure? (Solve by Completing the Square and round your solution to the nearest hundredth.)

\[
\begin{align*}
-16t^2 + 32t + 5 &= 17 \\
-16t^2 + 32t &= 12 \\
t^2 - 2t + 1 &= \frac{-3}{4} \\
(t-1)^2 &= \frac{4}{4} \\
t-1 &= \frac{2}{2} \text{ or } t-1 = \frac{-2}{2} \\
t &= 1.5 \text{ sec or } t = 3 \text{ sec}
\end{align*}
\]

So Gail can catch tape measure \( 0 < t < 1.5 \) seconds.

12. For which values of \( y \), given \( y = x^2 + bx + \left(\frac{b}{2}\right)^2 \), will you find 2 complex solutions?

\[
\text{when } y < 0
\]

13. Solve the following quadratic for \( x \) by Completing the Square.

What is the result?

\[
\begin{align*}
\frac{ax^2 + bx + c}{a} &= 0 \\
x^2 + \frac{bx}{a} + \frac{c}{a} &= 0 \\
x^2 + \frac{bx}{a} + \frac{b^2}{4a^2} &= -\frac{c}{a} + \frac{b^2}{4a^2} \\
\sqrt{(x + \frac{b}{2a})^2} &= \sqrt{-\frac{4ac}{4a^2} + \frac{b^2}{4a^2}} \\
x + \frac{b}{2a} &= ±\frac{\sqrt{b^2 - 4ac}}{2a}
\end{align*}
